Cyclodextrins

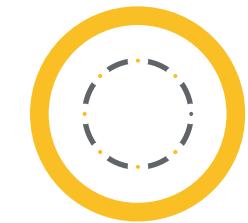

Synthetic strategies

Why modify cyclodextrins?

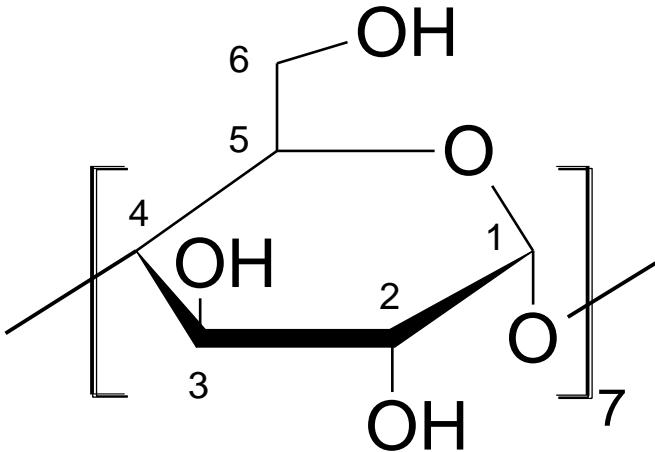

- Solubility improvement of the CD (and its complexes) in desired solvent, usually in water;
- better fit and/or association between the CD and its guest, with concomitant stabilization of the guest by changing its reactivity;
- more appropriate mimic of a binding site (e.g., in enzyme modeling) via attachment of specific groups; or
- formation of insoluble or immobilized CD-containing structures, polymers (e.g., for chromatographic purposes).

Characteristics of the Hydroxyl Groups

Less acidic, most nucleophilic

More acidic, less nucleophilic Most acidic, more nucleophilic

C1= anomeric carbon

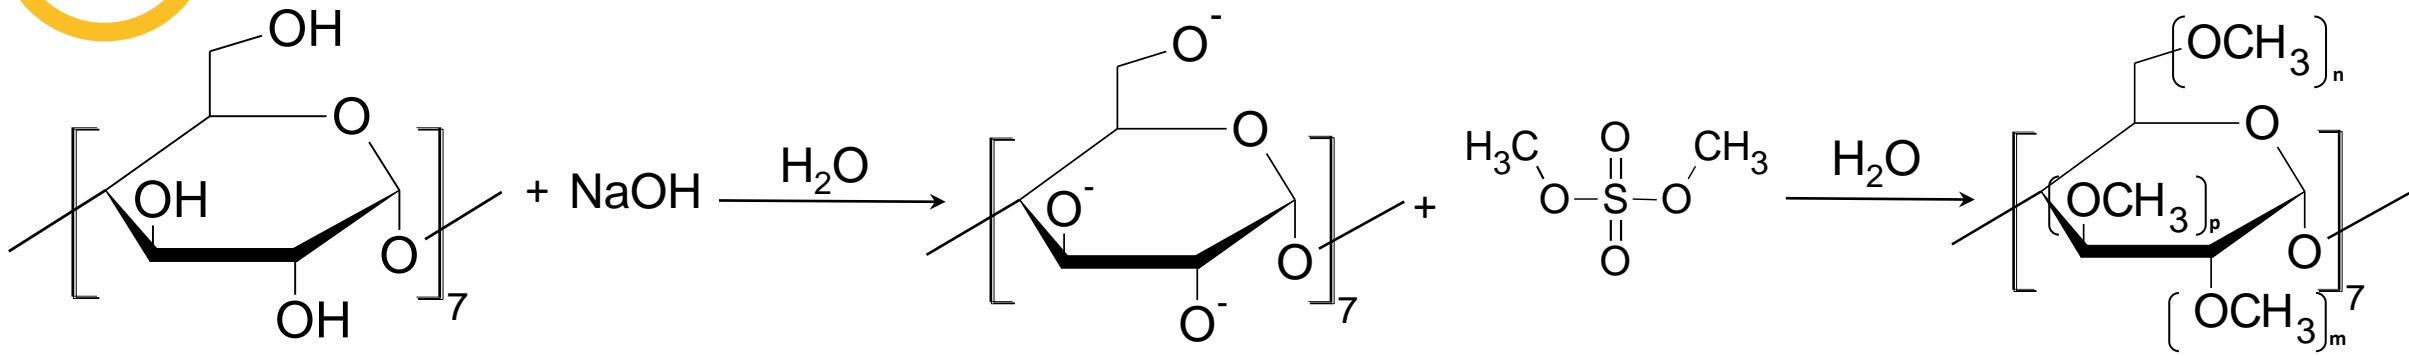

C6= methylene unit (-CH₂-)

C2= easy accessible

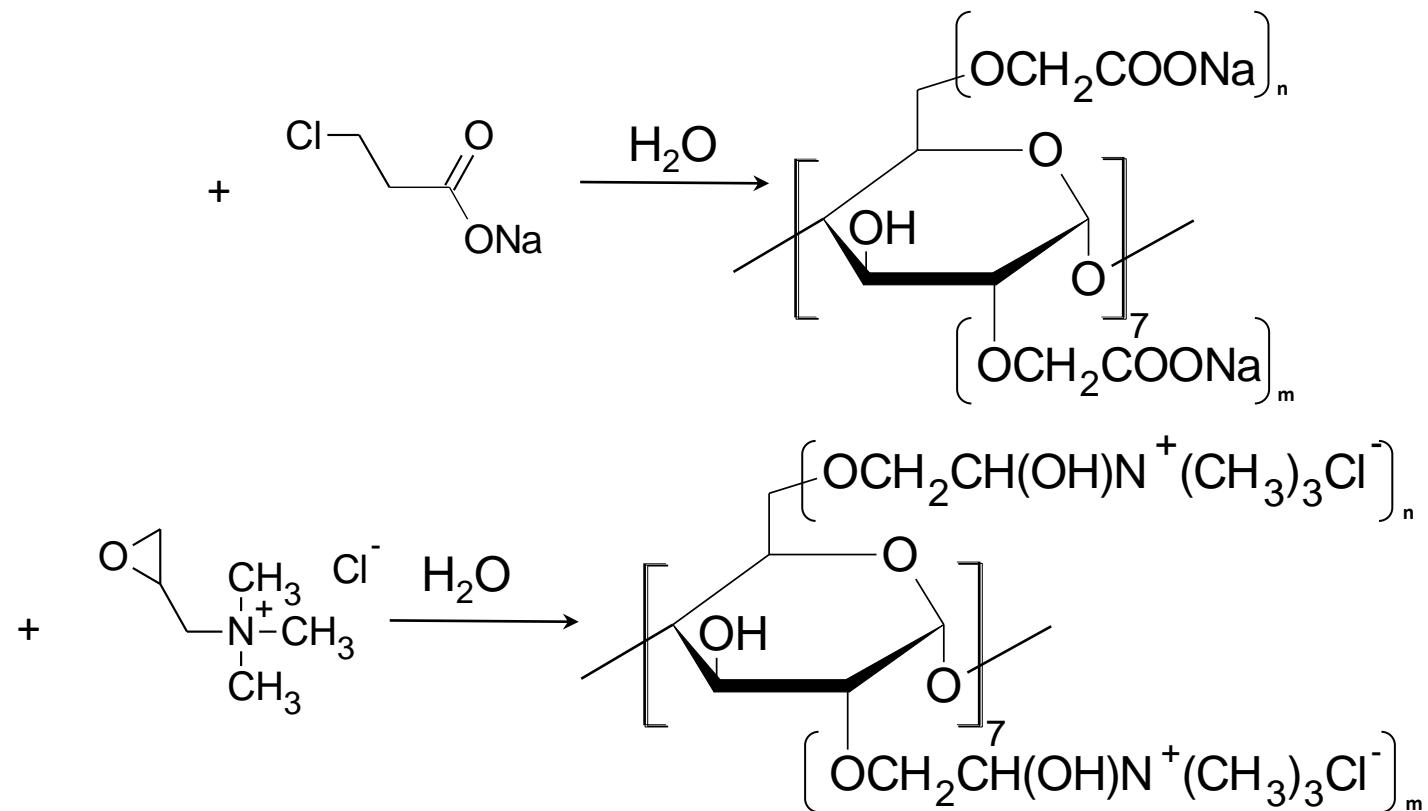

C3= most hindered, difficult to modify

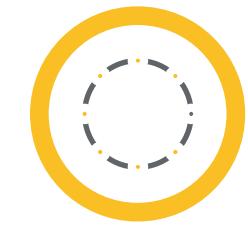

C4, C5= not involved in reaction

Random Alkylation

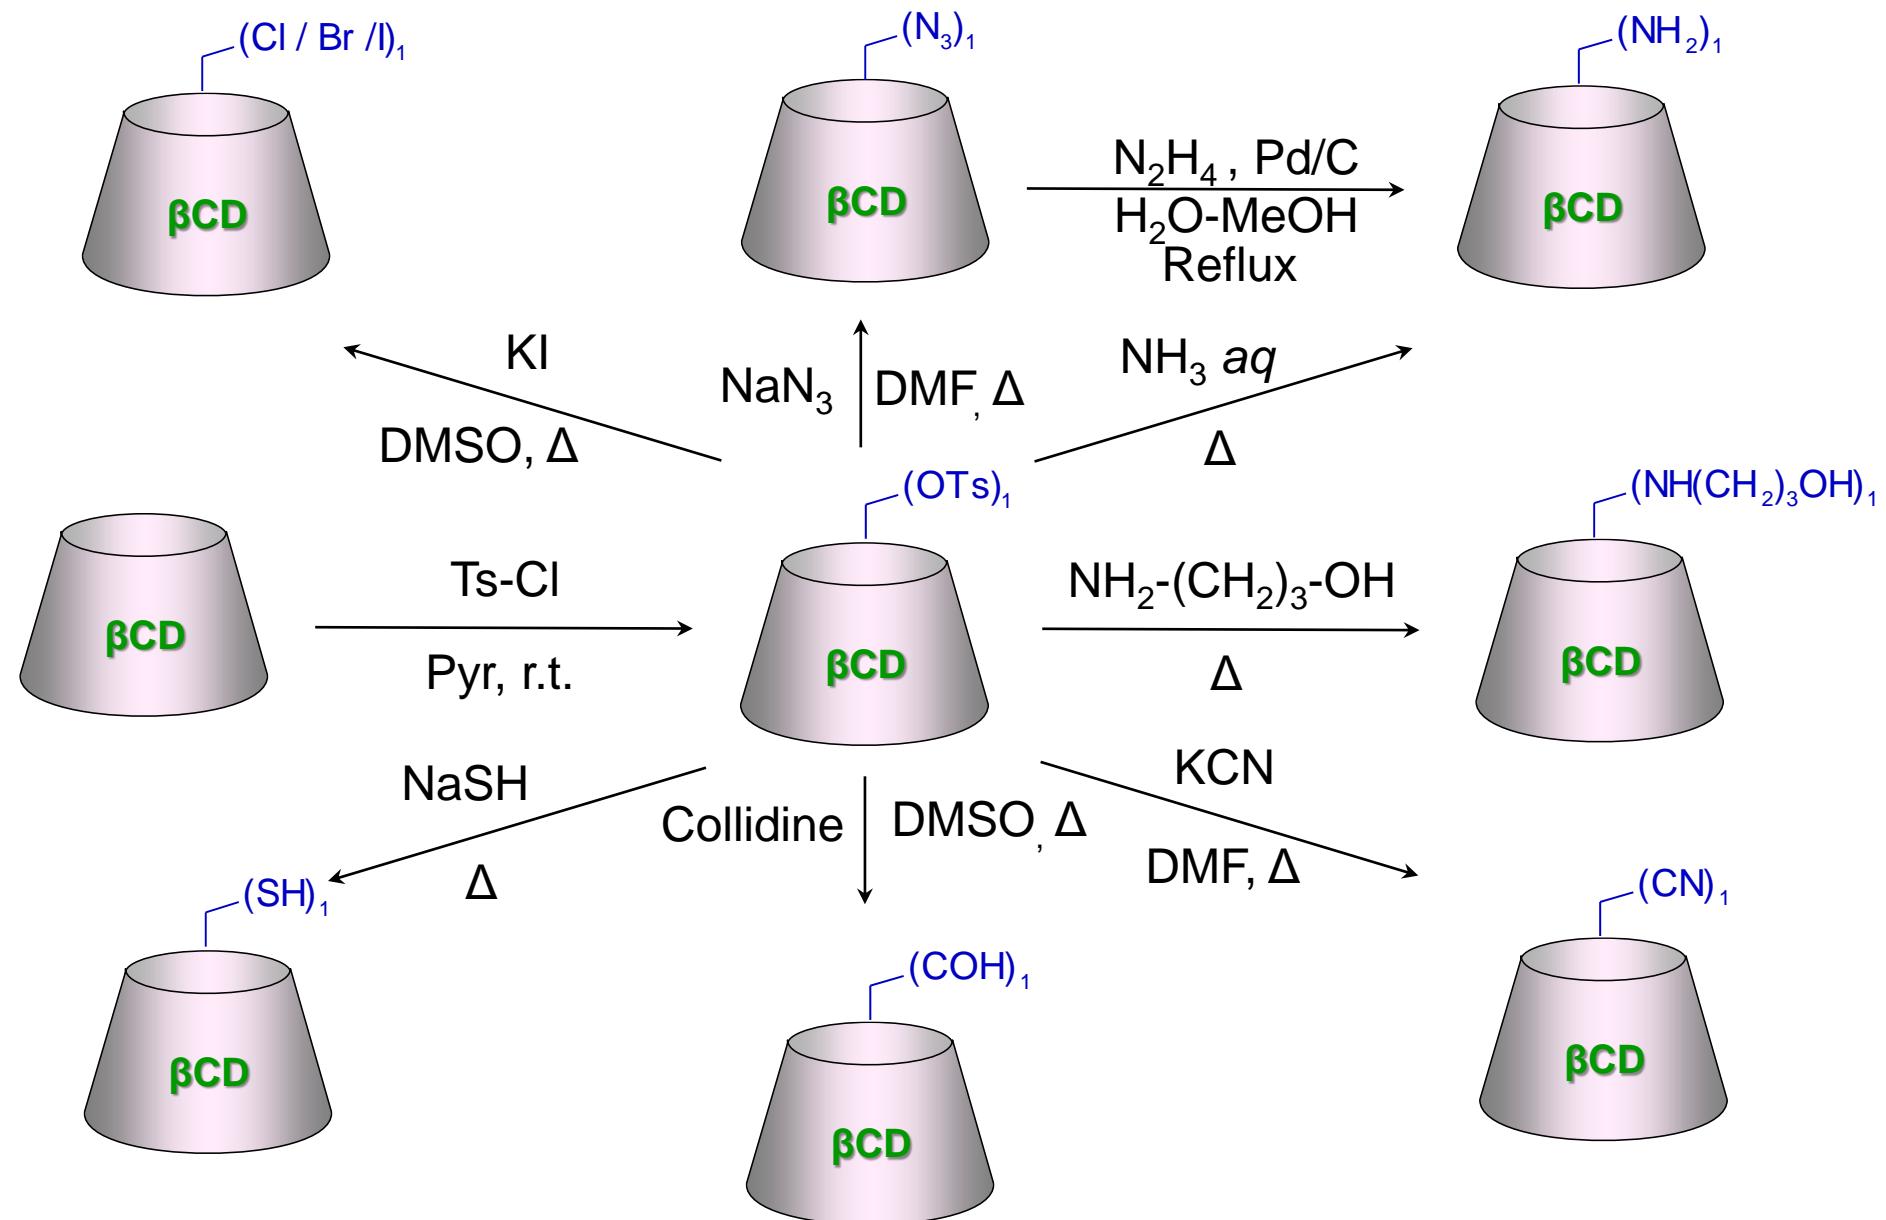

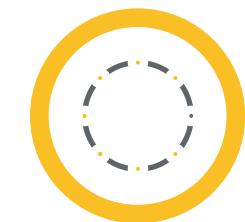

Regioselective with appropriate base
Degree of substitution can be controlled
Substitution pattern: O(2)>>O(6)/O(3)
The longer alkyl chain the more 2,6-O-selective.
High solubility in water and organic solvents.
Per-substitution difficult in water
5-1000 kg scale production.

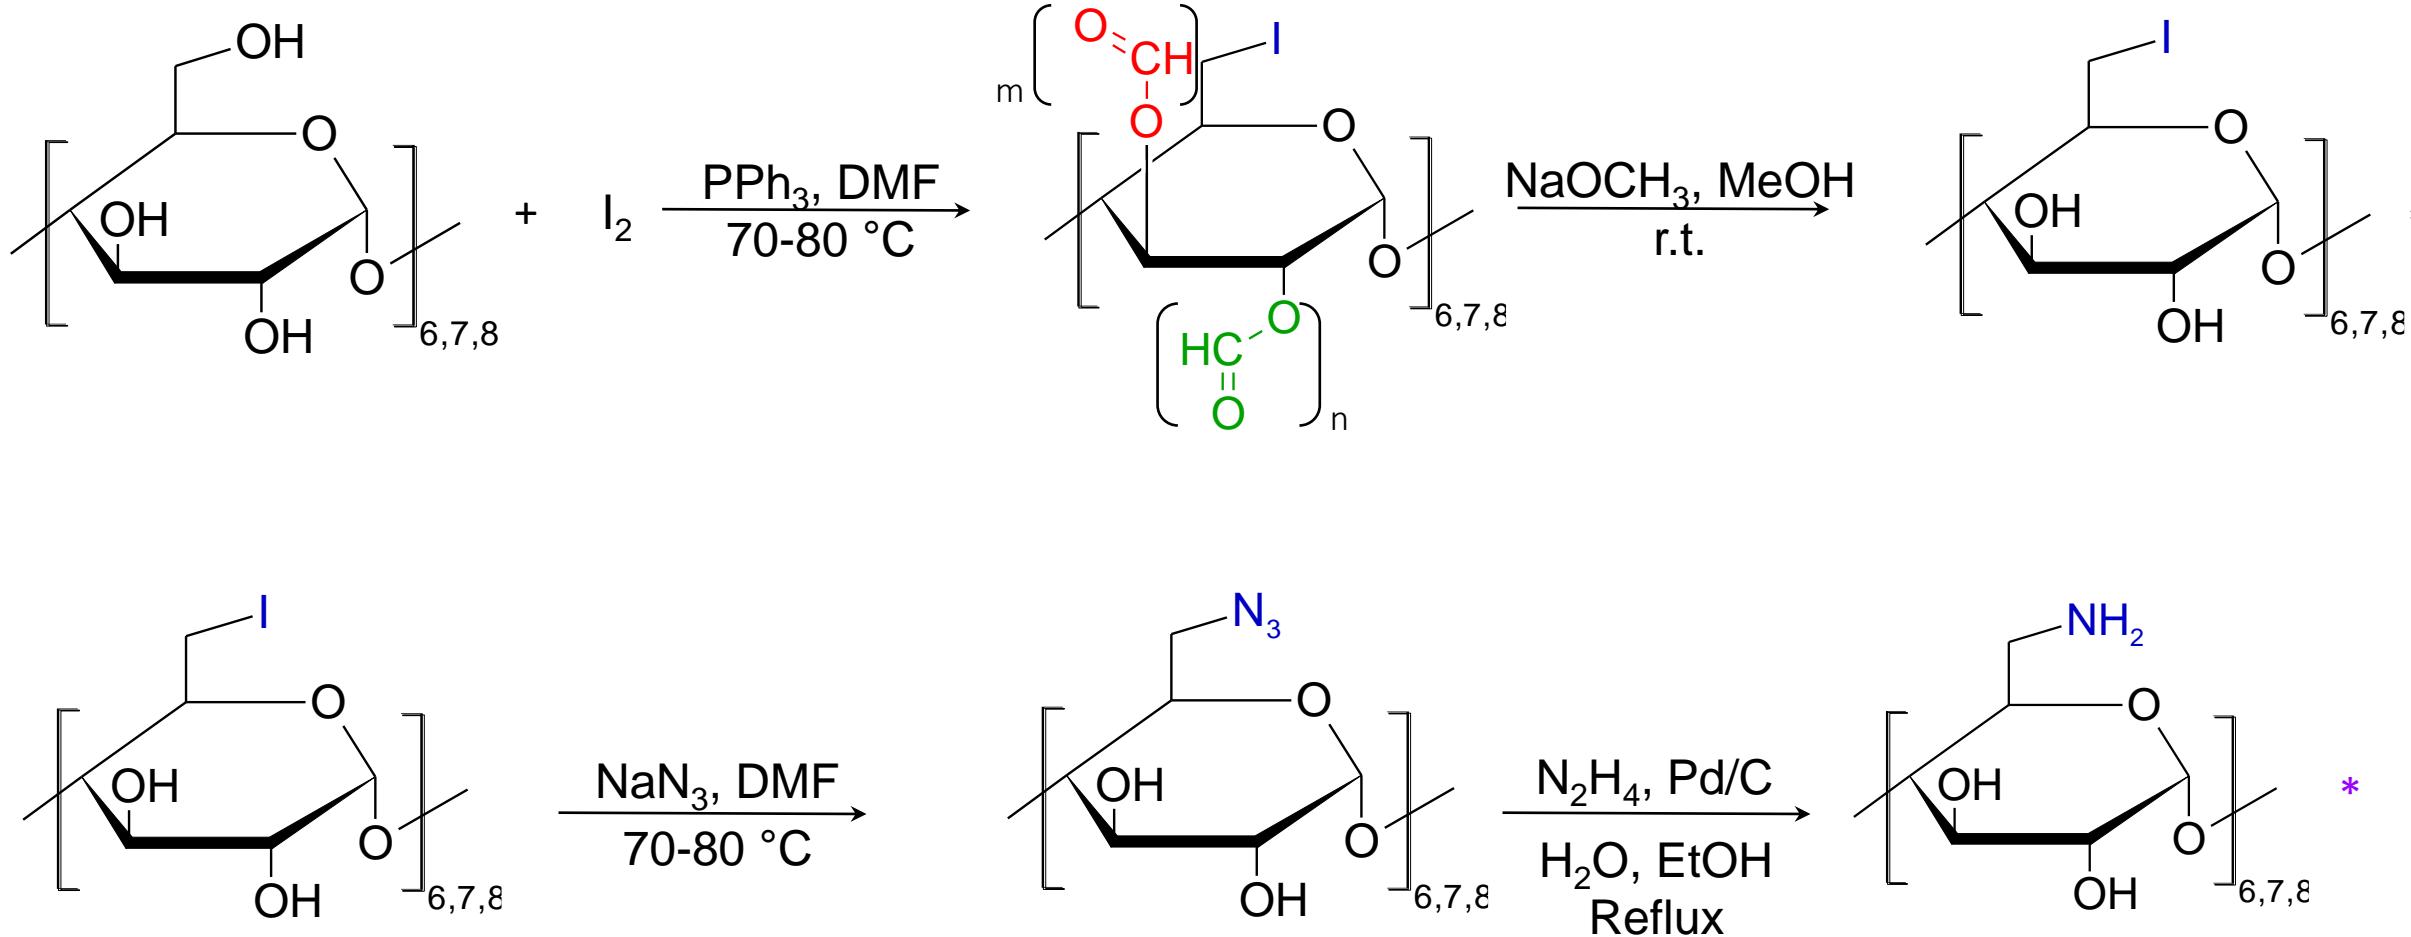

Mono-6-Tosyl- β CD, a Key Intermediate

Per-6-Halogen-CDs, Versatile Compounds

Per-6-Hetero-Substituted CDs

The Magic of DIBALH

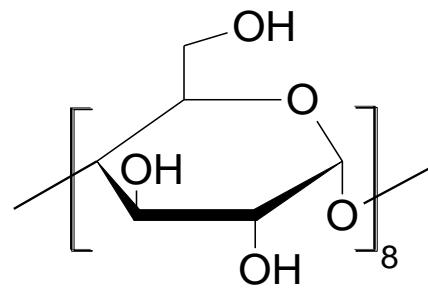

Diisobutylaluminium hydride

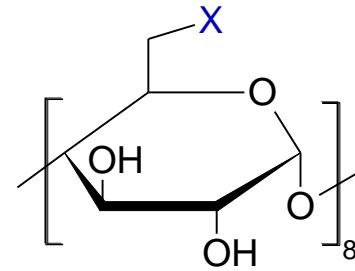

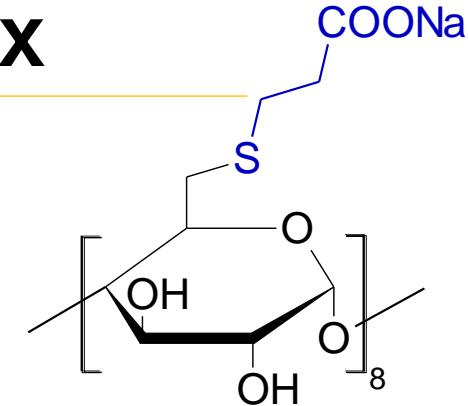

Synthetic Strategies for Sugammadex

$\xrightarrow[\text{70-75 } ^\circ\text{C, 14 h}]{\text{PPh}_3, \text{X}_2, \text{DMF}}$

$\xrightarrow[\text{Base1, DMF, } 65-70^\circ\text{C, 14 h}]{\text{HS}-\text{CH}_2-\text{COOH}}$

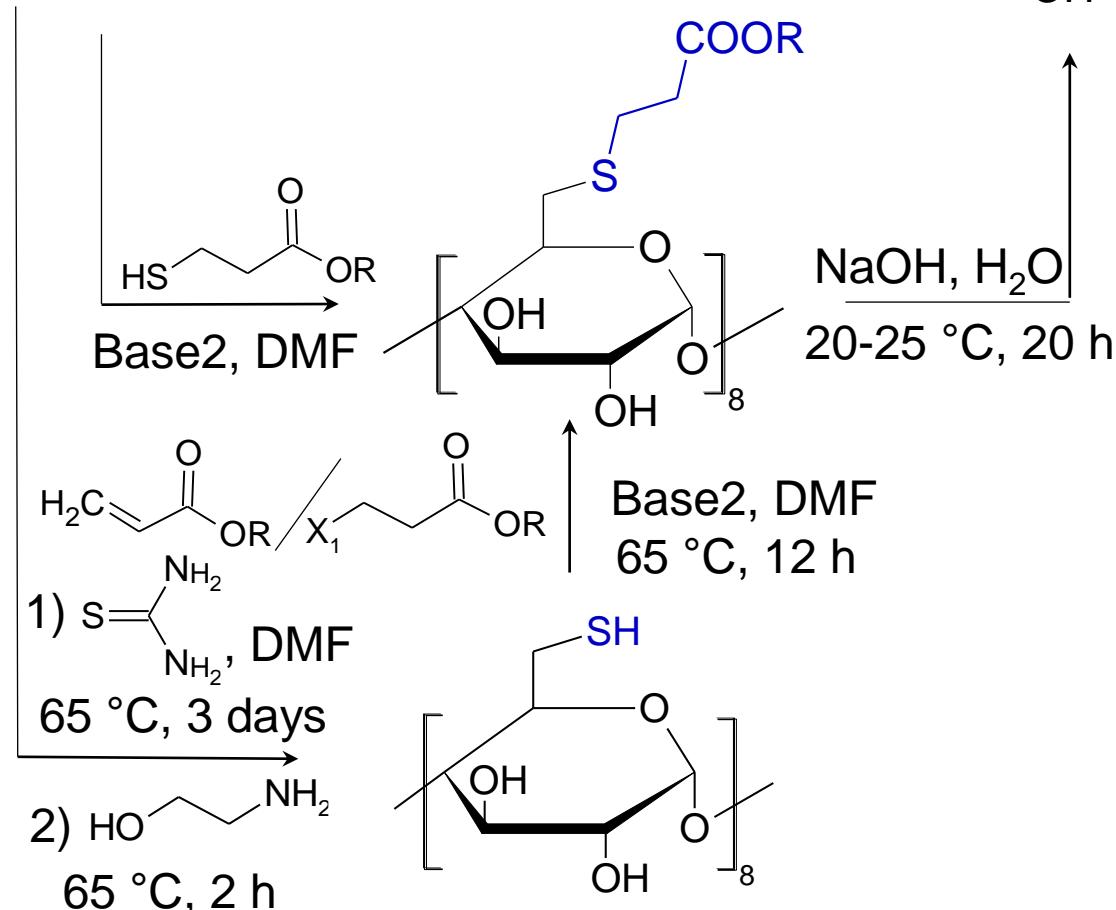

X= Br, I

X₁=Br, I, Cl

Base1= NaH, NaOR

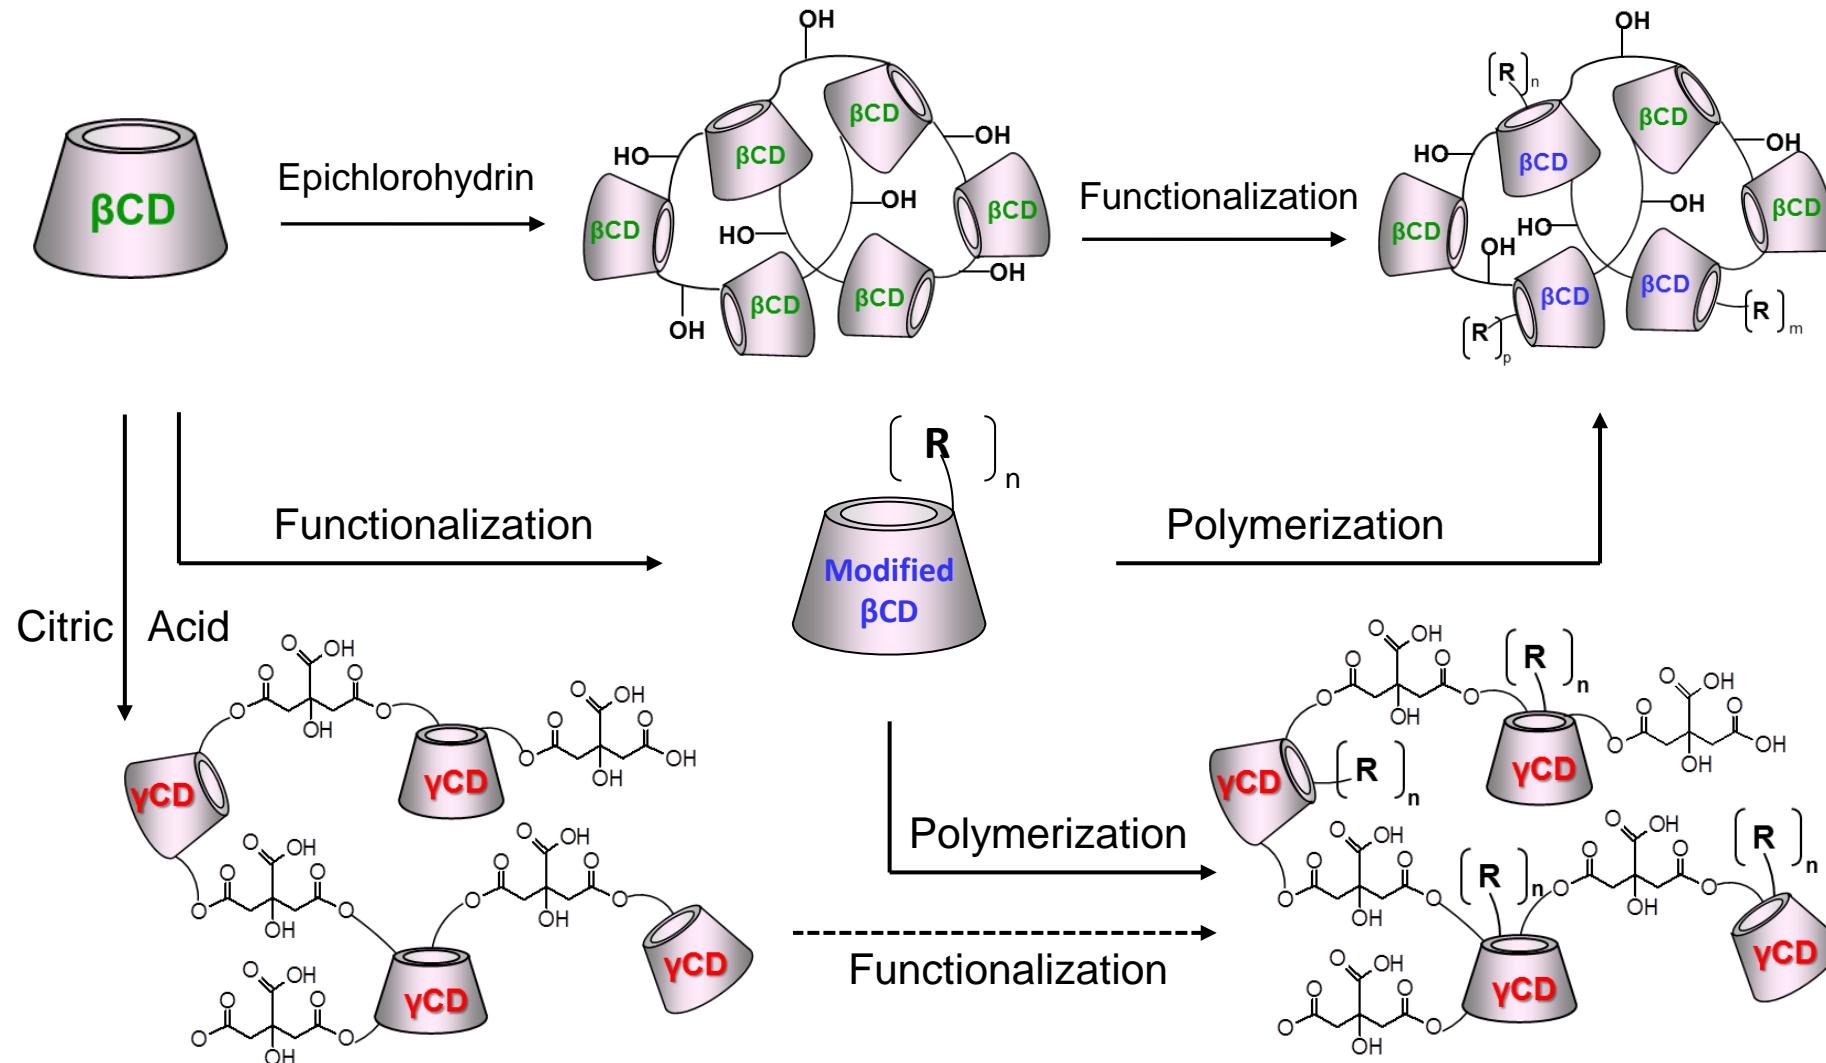

Base2= organic or inorganic base

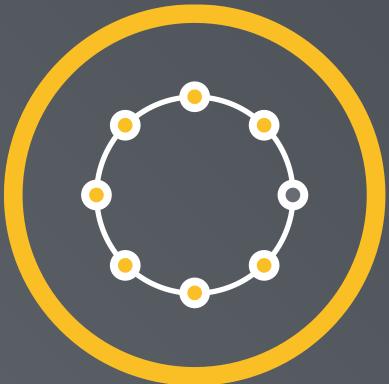

R= alkyl group

Cyclodextrin polymers
